Cumulative acres shown in the Active Incident Resource Summary Table may not be reflected in the YTD statistics due to a lag in units completing YTD adjustments in the SIT/209 Application. Otherwise, changes in agency YTD fires and acres reflect more accurate mapping or reporting adjustments.

Predictive Services Discussion:

A deep trough of low pressure will continue to drop south over the western US, bringing a significant cooldown to the Pacific Northwest and the Great Basin. Winds will still be strong along the Sierra Front with gusts 40-45 mph and along the leading edge of the trough east of the Rockies, but precipitation will begin to increase to the west. Snow is likely across western Montana and Wyoming. Showers and isolated thunderstorms will move across southern California in the afternoon, where southerly and westerly winds of 20-30 mph with gusts to 50 mph will continue across mountain ridges and desert passes. Down south, Hurricane Isaias is rapidly weakening as it moves inland across Alabama, though a narrow corridor of critical RH below 35% and north and northwest winds gusting 25-45 mph is likely to develop west of the storm in the afternoon.
